

Nuts and Bolts of Bubble Nasal C P A P

Jen-Tien Wung, M.D., FCCM

Neonatal Intensivist

Professor of Pediatrics

Columbia University Medical Center

New York City (CHONY)

CPAP

Continuous Positive Airway Pressure

- To a spontaneous breathing patient, a positive pressure is applied to the airways throughout the respiratory cycle
- Nasal CPAP has been used at Columbia University NICU since 1973 for >20,000 infants

CPAP

Effects

1. Increases transpulmonary pressure and functional residual capacity (FRC)
2. Prevents alveolar collapse, decreases intrapulmonary shunt and improves lung compliance
3. Conserves surfactant
4. Prevents pharyngeal wall collapse
5. Stabilizes the chest wall
6. Increases airway diameter and splints the airways
7. Splints the diaphragm
8. Stimulates lung growth
9. Bubble CPAP has HFV effect/stochastic resonance

Lung volume, lung weight, and protein and DNA contents at end of study were higher in CPAP-exposed than in control animals (all $P < 0.01$). Strain-induced growth of the immature lung. Zhang S. et al. J. Appl Physiol 1996;81:1471-6

```
graph TD; A((Premature baby)) --> B((Structural lung immaturity)); A --> C((Surfactant deficiency (RDS)))
```

**Premature
baby**

**Structural
lung
immaturity**

**Surfactant
deficiency
(RDS)**

CPAP

- CPAP is not just for RDS
- CPAP stimulates the growth of premature lung
- We keep the premature infants on CPAP, even on room air CPAP, as long as they are symptomatic (e.g., tachypnea, retraction or apnea & bradycardia.)

Waveform produced at
airway with underwater
Bubble CPAP

Amplitude 2-4 cm H₂O,
Frequency 15-30 Hz

Lee K-S et al: Biol Neonate 73: 69-75, 1998

Waveform produced at
airway with **HFOV**
(Sensormedics)

Set I-time 0.3
Set Frequency 10 Hz

Thome U: J Appl Physiol: 84(5):1520-7, 1998

CPAP

Indication

1. Diseases with low FRC, e.g. RDS, TTN, CPIP, PDA, pulmonary edema, etc.
2. Apnea and bradycardia of prematurity
3. Meconium aspiration syndrome (MAS)
4. Airway closure disease, e.g. bronchiolitis, BPD
5. Tracheomalacia
6. Partial paralysis of diaphragm
7. Respiratory support after extubation

Effect of alveolar radius and surface tension on alveolar stability w/ and w/o surfactant

$$\text{Law of LaPlace } P = 2 T/r$$

**Surfactant reduces surface tension (T).
Pressure is equalized in the large and
small alveoli**

$$\begin{aligned}r &= 2 \\T &= 2 \\P &= (2 \times 2)/2 \\P &= 2\end{aligned}$$

$$\begin{aligned}r &= 1 \\T &= 1 \\P &= (2 \times 1)/1 \\P &= 2\end{aligned}$$

Law of LaPlace : $P = 2T/r$

P : pressure

T : surface tension

r : radius

Larger alveolus

$$r = 2$$

$$T = 3$$

$$P = (2 \times 3) / 2$$

$$P = 3$$

CPAP

Smaller alveolus

$$r = 1$$

$$T = 3$$

$$P = (2 \times 3) / 1$$

$$P = 6$$

Natural response of surfactant producing cells to birth

Spain CL et.al. Ped. Research, 1987

At onset of breathing, amount of surfactant pool increases significantly

CPAP

Indication

1. Diseases with low FRC, e.g. RDS, TTN, CPIP, PDA, pulmonary edema, etc.
2. Apnea and bradycardia of prematurity
3. Meconium aspiration syndrome (MAS)
4. Airway closure disease, e.g. bronchiolitis, BPD
5. Tracheomalacia
6. Partial paralysis of diaphragm
7. Respiratory support after extubation

Meconium Aspiration Syndrome (MAS)

Meconium Aspiration Syndrome (MAS)

Inspiration

Expiration

Meconium Aspiration Syndrome (MAS)

With CPAP

No CPAP

Waterfall Effect

CPAP

Indication

1. Diseases with low FRC, e.g. RDS, TTN, CPIP, PDA, pulmonary edema, etc.
2. Apnea and bradycardia of prematurity
3. Meconium aspiration syndrome (MAS)
4. Airway closure disease, e.g. bronchiolitis, BPD
5. Tracheomalacia
6. Partial paralysis of diaphragm
7. Respiratory support after extubation

FiO2 vs flow meter readings

Oxygen Concentration (F_{IO_2})
— vs —
Flow Meter Readings

$$F_{IO_2} = \frac{.21 \dot{V}_{Air} + \dot{V}_{IO_2}}{\dot{V}_{Air} + \dot{V}_{IO_2}}$$

$\dot{V}_{Air}$
AIR FLOW
(liters/min.)

Expiratory Valves

- **Threshold resistors** – the level is determined by the force applied to the surface area of the valve. The pressure generated is independent of flow. (Water bubble CPAP)
- **Variable pressure-flow resistors** – the level of PEEP/CPAP is directly proportional to the product of the gas flow through the orifice of the expiratory pressure valve and the resistance of the valve. (Ventilator)

Bubble-CPAP vs Ventilator-CPAP

All infants with bubble CPAP had:

- a lower minute volume with a mean reduction in MV of 39% ($p < 0.001$)
- 7 % reduction in respiratory rate ($p = 0.004$)
- With no change in transcutaneous CO_2 and oxygen saturation values

Lee K-S et al: Biol Neonate 73: 69-75, 1998

Physiological Advantage of Bubble versus Ventilator-derived CPAP

- Lower PaCO_2
- Higher PaO_2 , PH, FRC
- Less V/Q mismatch
- Lower alveolar protein

Bubble Continuous Positive Airway Pressure Enhances Lung Volume and Gas Exchange in Preterm Lambs

Jane Pillow et al. Am J Respir Crit Care Med. 2007 ; 176(1): 63–69.

B-NCPAP vs V-NCPAP

- Randomized crossover study in 18 premature infants (<1500 g) with mild respiratory distress
- Work of breathing, breathing asynchrony, respiratory rate, heart rate, tidal volume, minute ventilation, lung compliance or TcPCO₂ was not significantly different
- TcPO₂ was higher with B-NCPAP (P=0.01)

Courtney, SE et al.:Journal of Perinatology (2011) 31, 44–50;

CPAP Devices (Interface)

- Head hood
- Face shield
- Face mask
- Nasal mask
- Nasal prongs – Hudson, Babi-plus nCPAP
INCA, Draeger, Fisher&Pakel, SiPAP,
Arabella, NeoPAP
- Nasal cannula – *Vapotherm*
- Nasal pharyngeal tube
- Endotracheal tube

Not all CPAP devices
are created equal

There is a learning curve
for CPAP therapy

Fisher & Pakel

INFANT FLOW™ nCPAP System

A Randomized Controlled Trial of Post-extubation Bubble CPAP vs Infant Flow Driver CPAP in Preterm Infants with RDS

Gupta s et al, J Pediatr 2009;154:645-50

	IFD CPAP	CPAP (F&P)	P value
Failure rate in infants ventilated for ≤ 14 days	28.6(%)	14.1(%)	0.046
Median duration of CPAP support	4 days	2 days	0.031
(+) blood culture	25%	20%	
BPD	30%	20%	0.60

Outcome	IFD CPAP (n=69)	F&P Bubble CPAP(n=71)	Odds ratio (95% CI)
Survival, No BPD	48(66%)	53(75%)	1.23(0.45-3.61)
Death before discharge	0(0%)	*4(5.6%)	
BPD at 36 weeks	21(30%)	14(20%)	0.60(0.28-1.32)
PDA requiring Tx	17(25%)	12(17%)	0.63(0.24-1.63)
Severe IVH/PVL	9 (13.5%)	11(15.6%)	0.96(0.37-2.49)
NEC (Bell stage 2 or higher)	3(4.3%)	5(7.0%)	1.72(0.39-7.49)
ROP requiring Tx	5(7.2%)	4(5.6%)	0.79(0.20-3.07)
Pneumothorax	0	0	

*4 death, 2 from NEC, 2 from sepsis. 3 of these infants had to be reintubated <24 hours after extubation

Total	27.4±2.4	5.9%	14.1%	5.0%	0.9%

Sahni et al. J Perinatol 25(1):41-6, 2005.

Nasal Cannulae

- The CPAP and FiO_2 delivered will depend upon the cannulae size, flow, anatomy of nose and space between cannulae and nose
- No safety mechanism to assure that excessive positive pressure is not given
- “ ---High-flow nasal cannulae should not be used as a replacement for delivering CPAP.”
– Kubicka et al. Pediatrics 2008;121:82-88
- “ --- easy may not be safe.” –Finer, 2005

CPAP Delivery System (Columbia)

$$\text{Resistance} = \frac{\text{Viscosity} \times \text{Length}}{\text{Radius}^4} \times \frac{8}{\pi}$$

ET tube ID:	Resistance (cmH2O/5lpm)

2	1.0
3	0.5
4	0.5
5	0.5

Nasal CPAP

Set up (1)

Nasal Prong CPAP Delivery System. (Hudson)

1. Oxygen blender
2. Flowmeter
(5-10 LPM)
3. Heated humidifier
4. Thermometer
5. Inspiratory tubing
6. Nasal cannulae
7. Velcro

Nasal CPAP

Set up (2)

8. Manometer (optional)

9. Expiratory tubing

10. A bottle containing a solution of 0.25% acetic acid filled up to a depth of 7 cm. Distal tubing immersed to a depth of 5 cm to create +5 cmH₂O

Bubble CPAP (Portable)

Nasal CPAP

Application (1)

1. Position the baby in supine position with the head elevated about 30 degrees
2. Place a small roll under the baby's neck
3. Put a pre-made hat or stockinet on the baby's head to hold the CPAP tubings

Nasal CPAP

Application (2)

4. Choose FiO_2 to keep PaO_2 at 50's or O_2 saturation at 85 – 95%

Nasal CPAP

Application (3)

5. Adjust a flow rate 5-10 lpm to:
 - a) provide adequate flow to prevent rebreathings CO_2
 - b) compensate leakage from tubing connectors and around CPAP prongs
 - c) generate desired CPAP pressure (usually 5 cmH_2O)

6. Keep inspired gas temperature at 37^o C

Nasal CPAP

Application (5)

7. Insert the lightweight corrugated tubing (preferably with heating wire inside) in a bottle of 0.25% acetic acid solution or sterile water filled up to a height of 7 cm. The tube is immersed to a depth of 5 cm to create 5 cmH₂O CPAP as long as air bubbling out of solution

Babi-plus Bubble PAP valve

Fisher & Pakel

Nasal CPAP

Application (6)

8. Choose the proper size of nasal Cannulae

CPAP Cannulae

<u>Size</u>	<u>B.W.</u>

Pressure = Force / Surface Area

Nasal CPAP

Maintenance (1)

1. Observe baby's vital signs, oxygenation and activity
2. Systematically check CPAP systems, inspired gas temperature, air bubbling out of acetic acid solution. Empty condensed water in the circuit
3. Check CPAP prongs position and keep CPAP cannulae off the septum at all times. A snug cap is used to securely hold the tubings in place and using self-adhesive Velcro to keep cannulae away from the septum if necessary

Nasal CPAP

Maintenance (2)

4. Suction nasal cavities, mouth, pharynx and stomach q4h and prn
5. Change the baby's position
6. Change CPAP circuit once a week

Nasal CPAP

Weaning

- CPAP is kept at 5 cmH₂O
- FiO₂ is adjusted to keep PaO₂ in 50's, or oxygen saturation around 90% (85 - 95%)

Weaning CPAP

There are 3 weaning methods

- Off CPAP when the infant is stable on room air without respiratory distress. Resume CPAP if tachypnea, retraction or requires oxygen supplement (preferred method)
- Cycling: where the baby comes off for a period then goes back on -gradually increasing the time off and reducing time on, and reducing the pressure gradually while leaving the baby on.....
- Switch to high flow nasal cannula which provides an unknown pressure equivalent to CPAP -except we don't really know how much.....

Three CPAP weaning methods

- M1:** Taken 'OFF' CPAP with the view to stay 'OFF'
- M2:** Cycled on and off CPAP with incremental time 'OFF'.
- M3:** As with M2, cycled on and off CPAP but during 'OFF' periods were supported by 2 mm nasal cannula at a flow of 0.5 l/min.

Methods of weaning preterm babies <30 weeks gestation off CPAP: a multicentre randomised controlled trial

CGA: corrected GA;

Arch Dis Child Fetal Neonatal Ed published online May 18, 2012

Nasal CPAP

Discontinued

- No tachypnea or retraction
- No apnea and bradycardia
- FiO_2 is usually room air

Nasal CPAP

Complications (1)

- Nasal obstruction from secretions or improper application of nasal prongs
- Gastric distention from swallowing air, especially in infants on aminophylline or caffeine
- Nasal septum erosion or necrosis
- Fluctuating FiO_2
- Air leak: $<5\%$, usually occurs during acute phase

Nasal CPAP

Complications (2)

- Pneumothorax, if occurs, usually occurs within the first few days of use, not after a week. Furthermore, pneumothorax is generally less severe and less frequent in infants on CPAP compared to intubated infants on mechanical ventilation.
- Most of complications are preventable
- The majority of the problems can be attributed to inappropriate use, wrong device or a lack of training and experience

INFANT FLOW™ mask

WARNING

- DO NOT PREVENT INFANT FROM FALLING WHEN ACCESS PANEL IS OPEN.
- DO NOT LEAVE INFANT UNATTENDED.
- DO NOT FORCE INFANT WHEN PULLING OUT. INFANT DISLODGING CAN OCCUR.

Feeding on CPAP

Baby may feed at breast

395 gms , On CPAP since birth

3 months old

BW 395gm, on CPAP for 82 days

480gm, 24 weeks, on CPAP since birth

CPAP

Novel Application

- Mechanical ventilation via nasal CPAP cannulae
- Preferably in SIMV, A/C or pressure support mode. Infant Star Sync is not available anymore.
(using Servo i with NAVA).
- PIP: 15-20 cmH₂O, PEEP: 5 cmH₂O
- Indications:
 - ✓ Frequent A&B
 - ✓ High PaCO₂
 - ✓ Laborious breathings

Mechanical Ventilation

Indications

1. Marked retractions on CPAP (not due to nasal obstruction)
2. Frequent apnea and bradycardia on CPAP
3. $\text{PaO}_2 < 50 \text{ mm Hg}$ with $\text{FiO}_2 > 60\%$
4. $\text{PaCO}_2 > 70 \text{ mm Hg}$ (except 1st ABGS)
5. Intractable metabolic acidosis
($\text{BD} > 10 \text{ meq/L}$ after Rx with NaHCO_3)
6. Other (Cardiovascular collapse, Neuromuscular disorder, Congenital diaphragmatic hernia, or for Surgery, MRI, Cardiac catheterization, etc.)

The Columbia Experience with CPAP

 **Morgan Stanley
Children's Hospital
of NewYork-Presbyterian**
Columbia University Medical Center

The Columbia Experience (1997-1999)

A retrospective database review for a cohort of all live inborn VLBW infants (BW 500-1500g) born between Jan 1, 1997 and Dec 31, 1999 (three calendar years).

- 320 infants were divided into three groups :

1) CPAP only group (n = 230): received only bubble NCPAP for respiratory support during the first 24 hrs of life.

2) CPAP failed group (n = 60): Infants managed initially with NCPAP who required intubation within 24 hrs of birth.

3) Vent only group (n = 30): Infants requiring intubation immediately following birth.

The Columbia Experience (1997-1999)

The strategy of

Early nasal CPAP therapy first and

**Surfactant replacement only for
rescue**

**does not jeopardize outcome of very
low birth weight infants**

CURPAP study

(R Plavka, U Simeoni et al. ESPR: Arch Dis Child 2008;93(Suppl II):A34)

- **Question**: is the prophylactic administration of surfactant superior to early rescue treatment in spontaneously breathing infants supported on nCPAP, in reducing the need for mechanical ventilation, during the first 5 days of life?
- **Population**: 25-28 weeks infants (European multicentre, n=24)
- **Outcome**:
 - . Duration of mechanical ventilation during the first 5 days of life
 - . Mortality, pulmonary and neurological morbidity

CURPAP study: method

CURPAP study: preliminary results

Parameter	nCPAP	CURPAP
Gestational age (median in weeks)	27	27
Birth weight (g)	913 $\pm$ 200	967 $\pm$ 221
Antenatal steroids	98%	96%
CPAP failure $\Rightarrow$ mechanical ventilation	31%	33%
Pneumothorax	1%	6.7%*
Mortality	10.7%	8.6%
BPD	22%	23.8%

50% rescue surfactant
(median =240 min of age)

Summary of the CURPAP study

- Prophylactic surfactant is **not** superior to early rescue surfactant therapy after CPAP
- Surfactant was halved in the nCPAP group
- Outcome was really good in both arms

	500-1000g	1000-1500g	1500-2000g	2000-2500g
BPD Rate (O_2 at 36 wks)	57%	19%	10%	17%
Early CPAP Rate	19%	48%	72%	75%
Early CPAP Failure Rate	67%	38%	24%	24%
Vent at anytime	86%	51%	25%	21%

Source: VON 2006, CDC Statistics 2006 & 2005

NICU Quality and Outcome, 2013

501 – 1500g

	MSCH	Vermont Oxford
Incidence of BPD	7.7%	34.6%
Nosocomial infection	5.8%	13.4%
Incidence of IVH	13.5%	25.9%
Incidence of Severe ROP	6.3%	7.8%
Incidence of NEC	5.5%	6.7%
Neonatal Mortality rate	9.5%	15.0%

Reasons for different results in previous CPAP studies

- The difference in devices used and experiences
- The difference in criteria of CPAP failure
- Studies did not show significant reduction of BPD because CPAP therapy was discontinued too early to take advantage of stimulation of lung growth.

**Do not brand a form of
therapy as useless,**

**when in reality it was only
inappropriately applied.**

**I Love My
CPAP**

I want Nasal CPAP, Please!

Thank You for your attention

VON Data Presentation: 10/21/2009

- * Focus on BW 501-1000 Gm Infants
- * 2 Subgroups by BW
 - 501-750 Gm
 - 751-1000 Gm
- * 2 Subgroups by Time Span
 - 1st period: 1998-2002
 - 2nd period: 2003-2008
- * Peek at characteristic/outcomes of “Type C” centers
- * A quick look at the Expanded Data results.

CPAP Before ETT Vent

501-1000 Gm

Surfactant at Any Time 501-1000 Gm

Severe IVH (3+4) 501-1000 Gm

Cystic PVL

Severe ROP

501-750 Gm

Oxygen at 36 weeks GA, <33 W (CLD)

501-1000 Gm

Survival w/o Specified Morbidities

501-1000 Gm

Case-Cohort Study

Boston-Columbia

- Linda VanMarter et al.: Do Clinical Markers of Barotrauma and Oxygen Toxicity Explain Interhospital Variation in Rates of Chronic Lung Disease?
- 441 infants born at 500 to 1500 g birth weight
Columbia (N=100) vs Boston Beth Israel and Brigham (N=341)

VanMarter LJ: Pediatrics 105 (6): 1194-1201, 2000

Center-Specific Respiratory Management

Hospital Specific Rates of CLD at 36 weeks PMA by Birth Weight and Gestational Age

Hospital Specific Rates of CLD at 36 weeks PMA by Ethnicity

CHONY Boston

CPAP	63 %	11 % *
Ventilation	29 %	75 % *
# days MV	13 d	27 d *
Surfactant	10 %	45 % *
Indomethacin	2 %	28 % *
Sedation	0 %	46 % *
Postnatal Steroids	3 %	4 %
BPD	4 %	22 % *
Mortality	9 %	10 %

*** P < 0.05**

(No significant differences in IVH, PVL, NEC or ROP)

Van Marter et al, Pediatr 2000; 105:1194-1201

Neurodevelopmental Outcome

**Sanocka U et al (PAS 2002)
assessed neurodevelopment at
age 6-8 years in two cohorts
VLBW infants (n=218), one from
New York & one from Boston,
that differed in their respiratory
management**

Long-term Neurocognitive Development

❖ Not all CPAP devices are created equal

❖ There is a learning curve for CPAP therapy

❖ The more you do it, the better you get at it. And the better you get, the easier you will feel.

Babi-plus nCPAP

Size 7 – size 0

Made of silicone, not PVC.
latex-free

Babi-plus nCPAP System

Concentration of saturated phosphatidylcholine (DPPC) in neonatal lungs by gestational age

Human

Rabbit, Lamb, Monkey
